HW2 Questions?

Add WeChat powcoder

1. Platform-independent Microservices

Assignment Project Exam Help

2. DevOps

<https://powcoder.com>

3. Infrastructure as Code

4. Data Science as Code

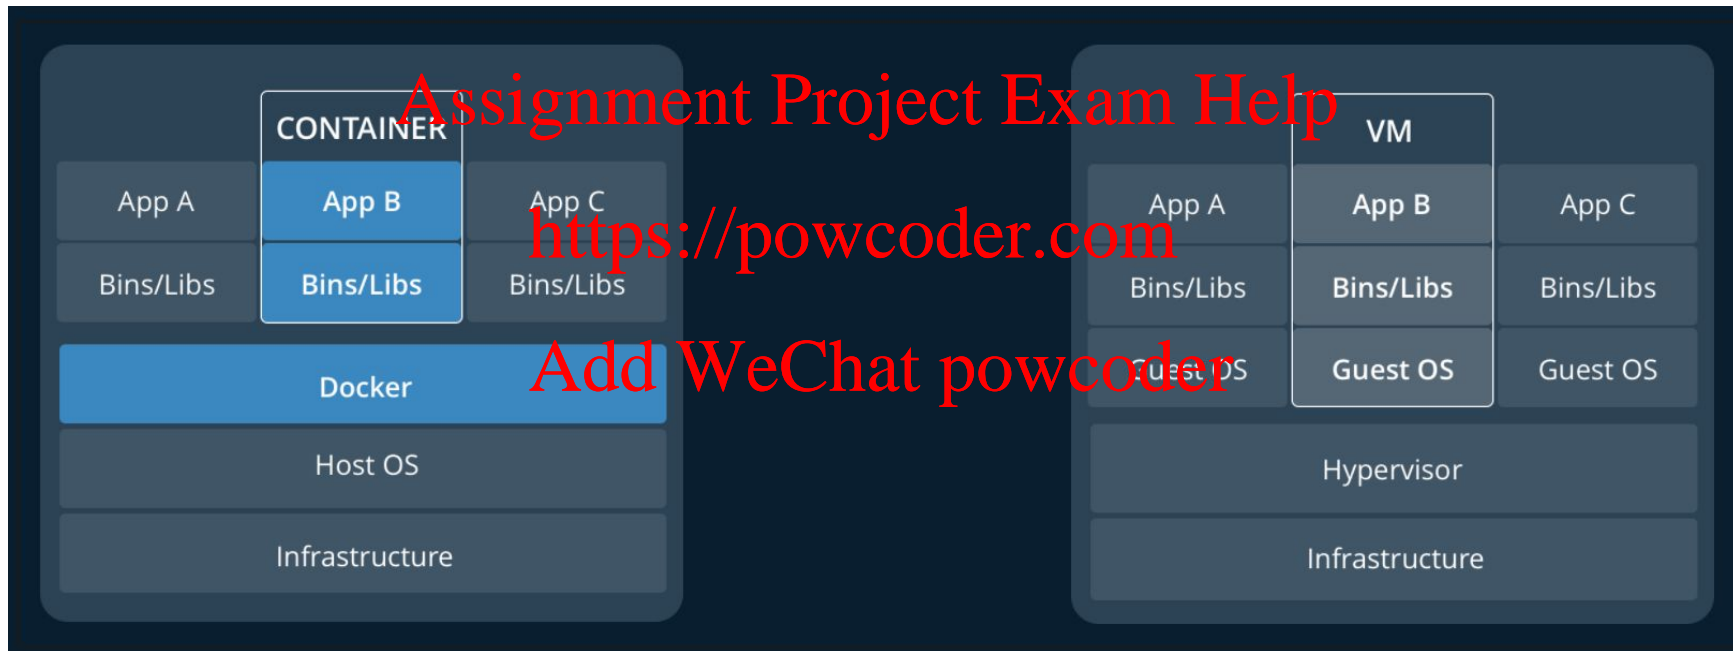

Add WeChat powcoder

Microservices using Docker

- What is Docker?
 - Software platform that allows you to build, test, and deploy applications quickly
 - The code, OS, libraries, etc. are bundled together as a unit called container, which is independently deployed at scale
 - Think of it as Open Source Lambda functions

Docker Containers

Why Docker?

- All the benefits of microservices PLUS
- Platform-independent
 - You can port your code between Cloud providers or accounts with less effort than porting provider-specific services
- Widespread developer support

Assignment Project Exam Help

Add WeChat powcoder

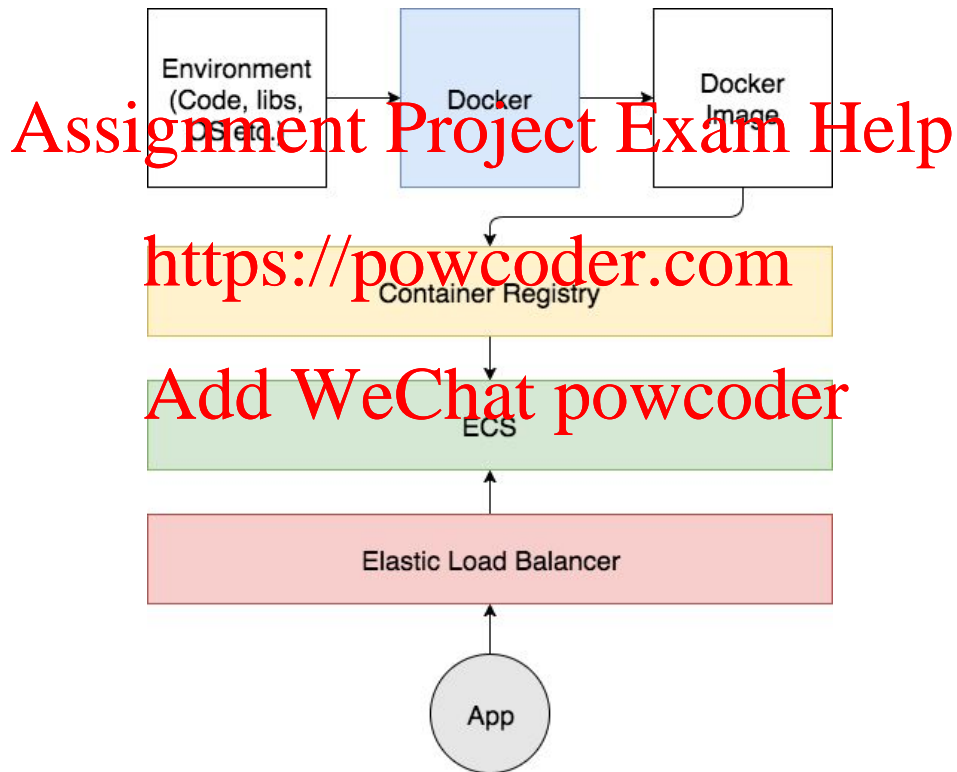

Docker on AWS

- The painful way
 - Run and manage your own Docker "swarm" on EC2
 - A cluster of Docker images orchestrated to run across one or more machines
- The easy way <https://powcoder.com> Add WeChat powcoder
 - Use Elastic Container Service (ECS), a highly-scalable, managed Docker container service from AWS

ECS Architecture

ECS Example

Assignment Project Exam Help

DEMO

Add WeChat powcoder

Recap:

Assignment Project Exam Help

1. You can use Docker to build your own microservices, which you can port across platforms.
<https://powcoder.com>
2. You can use ECS to run your Docker containers at scale.
Add WeChat powcoder

Platform-independent Microservices

2. DevOps

3. Infrastructure as Code

4. Data Science as Code

Add WeChat powcoder

What is DevOps?

“DevOps is a set of practices that automates the processes between software development and IT teams, in order that they can **build, test, and release** software **faster** and more **reliably**.” -- Atlassian

Release process stages

Release process stages

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Continuous integration goals

Continuous integration

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

1. Automatically kick off a new release when new code is checked in
2. Build and test code in a consistent, repeatable environment
3. Continually have an artifact ready for deployment
4. Continually close feedback loop when build fails

AWS CodePipeline

- Continuous delivery service for fast and reliable application updates
- Model and visualize your software release process
- Builds, tests, and deploys your code every time there is a code change
- Integrates with third-party tools and AWS

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

AWS CodeBuild

Assignment Project Exam Help

- Fully managed build service that compiles source code, runs tests, and produces software packages
- Scales continuously and processes multiple builds concurrently
- No build servers to manage
- Pay by the minute, only for the compute resources you use
- Monitor builds through CloudWatch Events

<https://powcoder.com>

Add WeChat powcoder

Continuous deployment goals

Continuous deployment

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

1. Automatically deploy new changes to staging environments for testing
2. Deploy to production safely without impacting customers
3. Deliver to customers faster, increase deployment frequency, and reduce change lead time and change failure rate

AWS CodeDeploy

- Automates code deployments to any instance and Lambda
- Handles the complexity of updating your applications
- Avoid downtime during application deployment
- Roll back automatically if failure detected
- Deploy to Amazon EC2, Lambda, or on-premises servers

Serverless Website Infrastructure

AI/ML Based Intelligent Email Responder

Improve customer experience and agent productivity by using Amazon Simple Email Service and Amazon Machine Learning services. This workflow comprehends the intent, identifies the next-best-action, and compiles all the data required for responding to a customer email.

- 1 Amazon Simple Email Service (Amazon SES)** captures emails received at corporate email exchange.
- 2 Amazon SES** writes the raw payload to **Amazon Simple Storage Service (Amazon S3)** and triggers a notification through **Amazon Simple Notification Service (Amazon SNS)**. This notification is captured by an AWS Lambda function that triggers the email responder workflow.
- 3** The email responder workflow performs the following tasks: a.) uses **Amazon Comprehend** for language, sentiment, and keyword extraction, b.) uses **Amazon Translate** for any preferred language translation for the agent, c.) calls intent extraction and next-best-action model endpoints deployed on **Amazon SageMaker** for better routing and responding of the email message, d.) performs data lookups from the enterprise data lake and ODS stores, e.) updates the transactional data stores with relevant updates and feeds enterprise data lake using **Amazon Kinesis Data Firehose**.
- 4** Based on confidence and completeness of the response email, the email responder workflow either sends a response email via email platform services such as **Amazon SES** or routes the email to the right queue for the customer service agent to pick up.
- 5** From the data collected, the intent extraction and next-best-action models are continuously improved using **Amazon SageMaker GroundTruth** and **Amazon SageMaker**.
- 6** Personalized email campaigns, additional email analytics, and reporting can be performed using **Amazon Pinpoint**, **Amazon Athena**, and **Amazon QuickSight**.
